

DeepMorph Clinical Analysis Report

SECTION 1 – Mutation Analysis

Mutation Status: Mutated
Mutation Confidence: 98.51%

SECTION 2 – Clinical Interpretation

Clinical Significance: Pathogenic
Risk Level: High
Clinical Confidence: 91.36%

SECTION 3 – Genetic Prediction

Predicted Gene: DNAH5
Gene Confidence: 99.99%

SECTION 4 – Disease Information

Disease Name: Primary Ciliary Dyskinesia
Primary Ciliary Dyskinesia is a genetic disorder affecting ciliary movement, resulting in impaired mucus clearance and chronic respiratory infections.

Symptoms:

- Chronic cough
- Recurrent sinus infections
- Persistent nasal congestion
- Frequent lung infections
